ITEMO — App Name

Core Concept

A simple personal inventory app that helps users record what they buy, find items through saved photos, and check their remaining stock.

Goal

- Reduce duplicate purchases
- Make household items easier to manage
- Easier to check household location
- Prevent unnecessary waste

1. Core Features

Feature 1: Add an Item

- Allow users to take a photo or upload a photo.
- Automatically identify and fill in the product name where possible.
- Record the purchase date (important).
- Record the expiry date, if applicable.
- Allow users to enter or confirm the quantity purchased.
- Save the actual product photo for future identification.
- Allow users to edit information if automatic detection is incorrect.

Feature 2: Find an Item

- Search by product name or product category.
- Display matching items using the photos saved by the user.
- Organise items into simple categories, such as, Personal Care, Cleaning Products and Electronics, and so on.

- Allow users to tap a photo to view the item's details, purchase date, expiry date and current quantity.

Feature 3: Check Item Stock

- Display the current quantity of each item.
- Allow users to increase or decrease quantities when purchasing, using or discarding items.
- Update the stock count accordingly.
- Keep one main product record for the same product, with separate purchase records when necessary to track different purchase dates or expiry dates.

2. Simple Home Screen

The home screen should have only three main functions:

1. **Add Item**
2. **Find Item**
3. **My Stock**

Recently added items and their quantities may be displayed at these functions page.

3. Key Requirements

- Simple, clean and user-friendly interface.
- Fast item entry with minimal manual typing.
- Visual search using the user's own saved product photos.
- Purchase date and quantity tracking.
- Expiry date field only when applicable.
- Users must be able to correct automatically detected information.
- Data should be saved securely and remain accessible when users reopen the app.

Important:

- Product names may be detected automatically.
- Purchase dates automatically record on the day user scanned/took the picture.
- Expiry dates should be captured from packaging when possible or entered and confirmed manually.
- The app must not assume these details are accurate without verification.

4. Development Scope

Please prioritise a functional Minimum Viable Product (MVP) with the three core features above. Avoid unnecessary features such as social sharing, complex analytics, AI shopping recommendations or advanced dashboards in the initial version.

Product Goal: Scan it. Find it. Check your stock.

Success Measure: Users can add an item quickly, retrieve its saved photo within seconds, and check their remaining quantity before buying more.
